

观影设计 Viewing Design

反射式超短焦投影技术可将图像投射至前挡风玻璃，提供影院式观影体验。用户可坐于车内或车头外置座椅观看。多车可拼接投影，形成巨幅画面，创造汽车影院。需考虑亮度、对比度及投影屏幕质量以优化体验。

Reflective ultra short focus projection technology can project images onto the front windshield, providing a cinematic viewing experience. Users can sit inside or outside the front seat of the car to watch. Multiple cars can be spliced and projected to form a huge image, creating a car theater. Brightness, contrast, and projection screen quality need to be considered to optimize the experience.

内饰设计 Interior Design

交互界面的设计参照Google materialdesign的设计风格，将UI在视觉上呈现深度感和立体感，由于整个中控都由屏幕代替如何由屏幕内容拟合出内饰的质感也是一个设计风格问题。

The design of the interactive interface follows the design style of Google Materialdesign, presenting a sense of depth and dimensionality visually. As the entire center console is replaced by a screen, how to fit the interior texture from the screen content is also a design style issue.

在延伸在车两侧的触摸屏上进行对汽车环境的控制与特定功能区的访问。相对于大尺寸的中控屏，两侧的长屏与桌板小屏的UX几乎只保有所有的一级菜单图标内容和必要的数据显示，需要乘客发起触控事件来显示对应的二级菜单

Control the car environment and access specific functional areas on the touch screen that extends twice in the car. Compared to the large-sized central control screen, the UX of the long screens on both sides and the small screens on the table only retain all the content of the primary menu icons and necessary data display, requiring passengers to initiate touch events to display the corresponding secondary menu
